GRM PATIENT CHART MANAGEMENT

DELIVERING A CONSOLIDATED
PATIENT RECORD

In an increasingly data-centric industry, healthcare organizations inability to create consolidated patient records results in increased costs, greater liability and a reduction in records access and security. GRM's Patient Chart Management solution is a suite of digital and physical information management products and services that collectively provide healthcare organizations with a solution for creating comprehensive patient charts and managing them.
PHYSICAL CHART STORAGE

We're able to index, archive and store your physical patient charts in our secure records center; leveraging our proven processes and tools so hard copy charts can be quickly retrieved and never misplaced.

WORKFLOW AUTOMATION

With our automated workflow technology, business rules can be put in place so that patient charts can be automatically sent to different departments or care facilities. As a result, care providers can quickly reference a patient's complete medical chart, allowing patients to progress more smoothly through their continuum of care.

CONSOLIDATED DIGITAL VIEW

Our vendor neutral archive consolidates EMR data from multiple legacy systems and serves as a central digital repository for completed patient records. This repository solves the accessibility issues created by the lack of interoperability between systems, ensures that only authorized users access patient information and provides hospital executives with a more comprehensive view of operations.

ADVANCED DATA CAPTURE

Physical medical charts and digital information can be intelligently captured, then patient data can be extracted, sorted and populated within a consolidated patient chart. These advanced capture capabilities ensure that the right patient data is associated with the right chart—guarding against bad data slowing down a patient's medical care process.

RETENTION MANAGEMENT

After we've securely stored organizations' patient information, we can implement a retention plan for both your physical and digital records that abide by state regulations and standards for destruction and purge these assets in accordance with NAID policy.

RELEASE OF INFORMATION

Whether it involves the release of physical patient charts or digital patient data, we have the methods and technology that allow us to quickly deliver vital patient information to the correct recipients. Our trained ROI teams ensure that all information is released in a HIPAA-compliant manner.
