

EHRCONNECT

DATA MANAGEMENT SOLUTIONS

BRIDGING THE GAPS IN PATIENT DATA MANAGEMENT.

GRM's EHRConnect suite of services provides innovative solutions that deliver valuable patient data management services that EHRs simply can't deliver. These simple to use yet sophisticated solutions cover both patient clinical data as well as patient financial data.

Whether employing one product or the full suite, these solutions pay immediate dividends.

EHR Consolidation

A single, collective view of data about a patient within your network likely doesn't exist, as episodes of care are housed in multiple EHRs. With our EHR Consolidation capability, clinicians can have an up-to-date view of an activity throughout your organization, and across time in our Patient Care Summary. This comprehensive Patient Care Summary, automatically updated with each new episode of care, is led by a synopsis of the patient's most recent medical care delivered by the network.

Patient Health Analytics

Our Patient Health Analytics offering gives your IT department a powerful set of tools designed to perform predictive analytics on vast quantities of clinical data gathered from multiple EMRs across your organization. This is the Big Data that yields the trends, conclusions and insights that yield better medical and operational decision making.

Legacy Data Archive

Under scenarios where it is determined that an a previously used EMR is no longer required and that the only role it serves is housing legacy patient records, GRM can transfer the data to VisualVault; maintain the integrity of the data, decommission the old EMR and deliver substantial savings on cancelled EMR licensing and maintenance fees.

Accounts Receivable Workdown

When information is housed in multiple old patient accounting systems, the risk exists of that data disappearing or becoming inaccessible. Some accounts may become uncollectable as a result. Our AR Workdown solution eliminates this risk by extracting records from legacy patient accounting systems and housing them in VisualVault.

Chart Acquisition & Verification

This solution is capable of reducing Days Sales Outstanding from weeks to days by identifying patient chart discrepancies early in the claims submission process. This early discrepancy detection capability and workflow automation solution dramatically reduces Timely Filing Denials; resulting in significant savings.
